BUSINESS PERFORMANCE DIAGNOSIS REPORT

Sales Analysis | 2025 | Excel • MySQL • Power BI

1. Executive Summary

This project evaluates business performance using 3,000 sales transactions recorded in 2025. The objective was to analyze sales, profitability, product categories, regional performance, sales channels, customer segments, discounts, returns, and delivery efficiency. Excel was used for data cleaning and preparation, MySQL for structured data analysis, and Power BI to develop an interactive dashboard for monitoring key performance indicators (KPIs) and presenting actionable business insights. The analysis provides an overview of business strengths and identifies areas requiring further investigation to support informed, data-driven decisions.

2. Key Business Insights

- **Overall Performance:** The business recorded ₹3.54 crore in total sales, ₹40.98 lakh in reported net profit, 598 unique customers, and an average order value of ₹11,813.
- **Product & Category Performance:** Electronics generated the highest category sales at ₹1.10 crore and profit of ₹15.10 lakh. Laptop led the analyzed products in sales and net profit, while Smartphone recorded the highest units sold at 346.
- **Regional Performance:** North recorded the highest regional sales at ₹97.26 lakh, while East recorded the lowest at ₹79.12 lakh.
- **Sales Channel Performance:** Website generated the highest sales at ₹1.41 crore and profit of ₹20.06 lakh among the three channels.
- **Monthly Trends:** August recorded the highest monthly sales of ₹35.82 lakh and net profit of ₹4.11 lakh, while June recorded the lowest monthly sales of ₹20.90 lakh and net profit of ₹2.52 lakh.
- **Returns & Delivery:** A total of 289 orders were returned, representing a 9.63% return rate. Additionally, 701 orders (23.37%) experienced delivery delays.
- **Discount Effectiveness:** Average net profit per order was ₹1,299.57 for discounted orders compared with ₹1,879.25 for orders without discounts.
- **Customer Experience:** The average customer rating was 4.11/5. Late Delivery and Changed Mind were the most frequently recorded return reasons, with 62 returns each.
-

3. Business Problems Identified

- **High Delivery Delays:** Nearly one in four orders was delayed, indicating a need to investigate delivery timelines and operational efficiency.
- **Product Returns:** The 9.63% return rate highlights an opportunity to examine return reasons, product quality, order accuracy, and category-wise return patterns.
- **Discount Profitability:** Discounted orders showed lower average net profit per order, making it important to evaluate discount effectiveness and protect profit margins.
- **Regional Performance Gap:** Sales differed across regions, suggesting the need to investigate regional demand, product mix, and sales opportunities.
- **Profitability Validation:** Loss-status classifications and the reported net profit KPI should be reconciled with final SQL calculations before publishing the results.

4. Business Recommendations

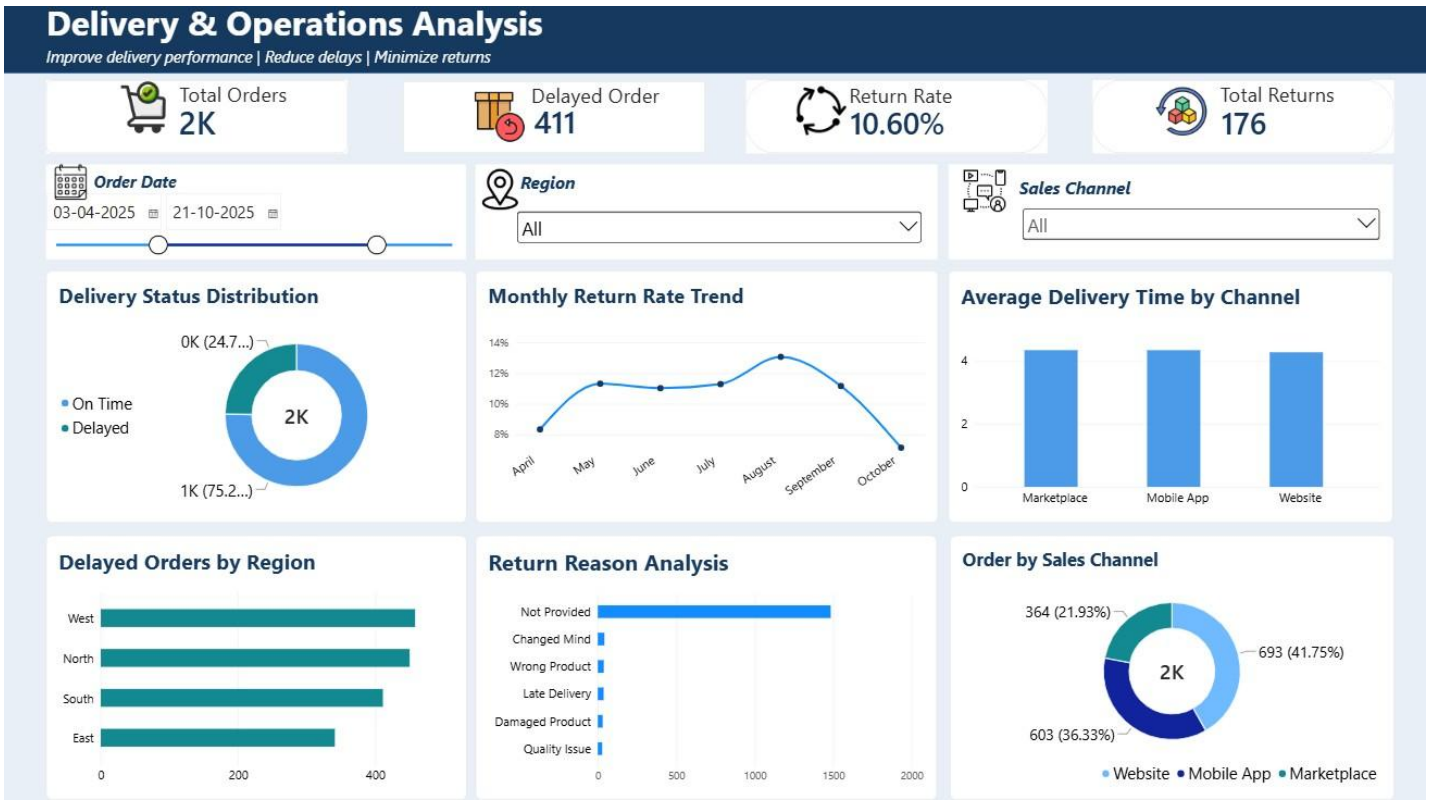

- **Improve Delivery Efficiency:** Analyze delayed orders by region and delivery duration, identify recurring bottlenecks, and monitor on-time delivery rates.
- **Reduce Returns:** Investigate common return reasons and category-level patterns, particularly in Fashion and Electronics, to identify improvement opportunities.
- **Optimize Discounts:** Compare average profit per order and profit margins across discount levels before expanding promotional offers.
- **Strengthen Sales Strategies:** Study Electronics, leading products, the North region, and the Website channel to identify opportunities for sustainable growth.
- **Monitor Key KPIs:** Use the Power BI dashboard to track sales, net profit, order returns, delivery delays, and customer ratings regularly.
-

5. Conclusion

The analysis highlights strong sales performance in Electronics, the North region, and the Website channel, while identifying delivery delays, returns, and discount profitability as key areas for further investigation. By monitoring these indicators and applying targeted improvements, the business can make better-informed decisions, improve operational efficiency, and work toward sustainable profitability.

6. Power BI Dashboard

7. Data Note

The analysis is based on 3,000 sales transactions from 2025. Data was cleaned and analyzed using Excel and MySQL, with Power BI used for dashboard visualization. Findings reflect the available dataset and may require further validation before business decisions are made.
